*Specification*

Amendments to the specification filed on 2<sup>nd</sup> September 2008 have been acknowledged.

*Reasons for Allowance*

In response to after-final amendment and arguments presented and filed on 2<sup>nd</sup> September 2008, the examiner agrees with the applicant that the best prior art of record does not very clearly teach or imply “sets of synchronization information frame transmission start time information are determined on *grounds of priorities of sets of data transmitted from said plurality of network terminals*” as claimed in amended independent claims 2, 11, 14, 15 and 17; and, thus, are deemed to be non-obvious. Claims 3, 5, 7, 9, 12 and 16 are dependent on the independent claims 2, 11 and 14, and thus, are also deemed to be non-obvious.

*Conclusion*

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

1. Maeshima et al, US 6987967 B2: when a master control station becomes incapable of communication, it is set that a plurality of slave control stations perform communication control as control stations sequentially based on preset priority order
2. Sugaya, US 6608824 B1: a control station is provided to control transmission in a network wherein renewal of transmission control information can be performed by a simple control

3. Saleh et al, US 20020054572 A1: changes that occur in the network, whether caused by failed links, newly provisioned connections, or added/failed/removed nodes, are broadcast throughout the network, using special protocol packets and procedures, wherein the topology distribution normally runs concurrently with, and in parallel to, failure restoration activities, but at a much lower priority

4. Donahue et al, US 6411616 B1: an asynchronous character based master-slave protocol that allows a master controller to encapsulate and transmit binary and ASCII data to a slave subsystem, wherein packets are delimited by a sequence of characters, known as flags, which indicate the beginning and end of a packet
